

Extract, Transform and Load System for Leading UK Pharma Company

The challenge:

This leading UK Pharmaceutical Company had a solution that had been custom developed to extract and transform data from their accounting system so it could be sent on to their Data Warehouse. All well and good until the platform it was built on ceased to exist, was no longer supported and was becoming increasingly unstable. So much so that essential data was being lost due to the incompatibility of systems and some data was not available until after midday if not later, losing them half a day's business and related revenue.

They came to Verasseti in search of a stable and supported IT solution, one that would enable them to extract and transform their accounting data quickly and efficiently.

Our unique solution:

We developed a simple and scalable data extract, transform and load platform, a system that enables our client to extract and transform their accounting data. The data is then quickly and easily loaded into their Data Warehouse, enabling people across the business to run all of their critical reports each day.

The results:

Having completed this project, the system has been fully documented and continues to be supported by ourselves. In using this new platform our clients no longer have to worry about losing their important accounting data and incompatibility between systems.

Reports are now always available for them to access first thing in the morning as processing times have gone down from an average of eight hours to less than four.

Technologies:

Microsoft SSIS (SQL Server Integration Services)
SQL Server
JD Edwards
Cognos
